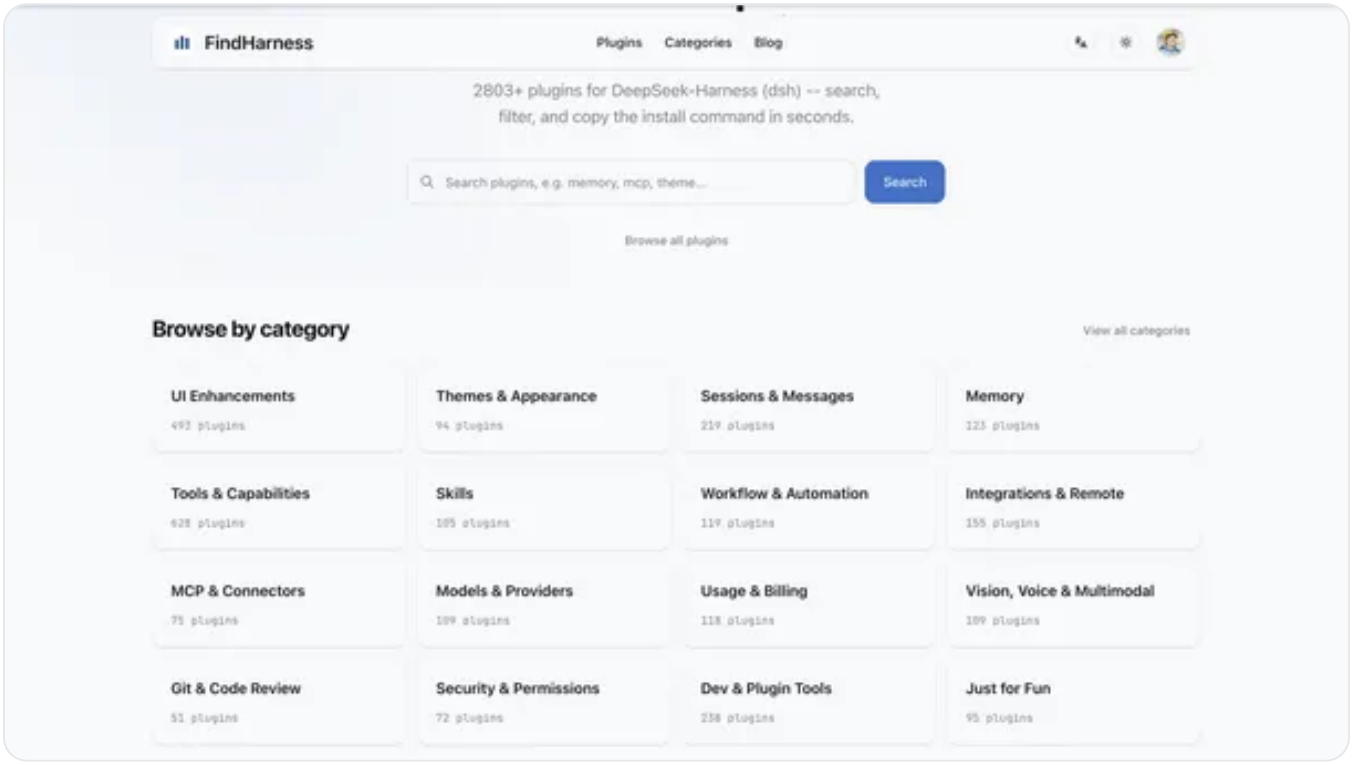
FindHarness

A community index for DeepSeek-Harness plugins, with fast search, filters, and one-click install commands.



About

FindHarness is a DeepSeek-Harness plugin directory for browsing, filtering, and installing dsh plugins. It indexes the plugin ecosystem so you can search a large catalog, narrow results by category, and copy an install command without leaving the site.

What is FindHarness

FindHarness is a community-run directory for DeepSeek-Harness (dsh) plugins. It exists because DeepSeek-Harness is described as an open-source agent harness where everything is a plugin, but there is no official plugin marketplace.

Instead of trying to sort through repos manually, this site gathers the ecosystem into one searchable index. The homepage highlights that it tracks 3,418+ plugins, which gives you a sense of the current catalog size. The goal is simple: help you discover a plugin, compare options, and install it faster.

In practice, FindHarness works like a specialized plugin catalog for the DeepSeek-Harness ecosystem. It is not the harness itself, and it is not the official repository. It is an independent discovery layer built around search and browsing.

Key features

Search across the plugin index: FindHarness lets you look up dsh plugins by name and explore the catalog without starting from scratch.

Filter by category: The site lists categories such as UI Enhancements, Themes & Appearance, Sessions & Messages, Memory, Tools & Capabilities, Workflow & Automation, Integrations & Remote, MCP & Connectors, Models & Providers, Usage & Billing, Vision, Voice & Multimodal, Git & Code Review, Security & Permissions, Dev & Plugin Tools, and Just for Fun.

Copy install commands quickly: The core workflow is to find a plugin and copy its install command in seconds, which is useful when you already know what you want to add.

Browse by popularity and recency: The homepage surfaces trending, recently updated, and most saved plugins, giving you multiple ways to prioritize what to inspect.

Large ecosystem coverage: The site shows counts per category and a total of 3,418+ plugins, so it is useful for scanning a broad plugin landscape.

Plugin detail signals: Listings can include repository-style author information, stars, update timing, and license labels when available from the index.

How to use it

Open FindHarness in your browser.

Start with the search bar if you already know a plugin name or a rough topic.

Use the category pages to narrow the field when you are comparing similar plugin

Review the plugin entry for the repository name, popularity signals, update recency, and license when shown.

Copy the install command from the listing and paste it into your DeepSeek-Harness workflow.

If you are exploring, check the trending and recently updated sections to discover active plugins before you commit to one.

This is especially helpful when you want a plugin directory instead of scanning GitHub repos or reading through scattered documentation. The site is designed to reduce the time between discovery and installation.

Who it is for

DeepSeek-Harness users who want a quicker way to find plugins for their harness setup.

Agent builders who need a curated view of the plugin ecosystem before adding capabilities.

Developers and tinkerers comparing plugin options by category, popularity, or update activity.

Teams evaluating integrations who want to see what kinds of memory, workflow, connector, or UI plugins exist for dsh.

People new to dsh who need a single place to understand what is available before installing anything.

Because the index spans many plugin types, it can support both broad exploration and narrow, task-driven searches. Someone looking for a memory helper will use it differently from someone hunting for a UI layer or a connector.

What to know before you use it

FindHarness is an index, not the official DeepSeek-Harness project. The official repository named on the site is deepseek-ai/deepseek-harness.

The site says it is community-run and that DeepSeek-Harness does not have an official marketplace, so the listings are aggregated from the ecosystem rather than managed by the core project.

Plugin metadata such as stars, licenses, and update times may vary by listing and may not be complete for every entry.

The directory helps you discover and copy install commands, but it does not replace reading the plugin's own repository, README, or license before use.

For security-sensitive or production decisions, check the upstream project source and documentation directly, especially when permissions, connectors, or billing-related behavior matters.

If a plugin listing looks stale or incomplete, the official repository or the plugin maintainer's page should be treated as the source of truth.

FindHarness is most valuable when you want a fast, centralized way to browse the dsh plugin ecosystem and move from discovery to installation with less friction. If you are working inside DeepSeek-Harness, it can save time; if you need authoritative details, always verify against the plugin's upstream source before deploying anything.
